

SolarTecno is a product line dedicated to the movement of solar trackers and concentrators, made up of solar panels or concentrator panels. The slew ring which supports and moves the mobile part is driven by Transtecno gearmotors. The motors we recommend are either three phase or single phase AC motors or 12/24V DC motors from the EC range. Both can be combined with the FT146 shaft mounted gearbox. Planetary gearmotors from the P or ECP range, wormgearmotors with prestage from the CMP or ECMP range along with all the other solutions on our website are also available.
